

“FontForge Installer” automates most of the installation process – just double click and it’ll walk you through it.

## Scripts

Double click the scripts to run them. You might want to copy this folder to e.g. your documents folder for future use.

## xQuartz

xQuartz is needed for FontForge to work on mac and the installer will check if you have the latest version of xQuartz.

Remember to log out and back in after having installed xQuartz and before installing FontForge.

When you run “FontForge Installer” the second time it will automatically detect that you now have the latest version of xQuartz and proceed to install FontForge.

It’s important that key equivalents aren’t enabled – the installer will tell you when to change this. Your settings should look like the screenshot below.
